DECLARATION BY THE STUDENT

We **AL THAMEEZ S (211422104038), ALLEN RODDICK A (211422104040)**, hereby declare that this project report titled '**FILE AND FOLDER ORGANISATION BOT**' under the guidance of **Dr.P.J.SATHISH KUMAR BE.,M.Tech.,Ph.D., Professor** is the original work done by us and we have not plagiarized or submitted to any other degree in any university by us.

ACKNOWLEDGEMENT

We would like to express our deep gratitude to our respected Secretary and Correspondent **Dr.P.CHINNADURAI, M.A., Ph.D.**, for his kind words and enthusiastic motivation, which inspired us a lot in completing this project.

We express our sincere thanks to our Directors **Tmt.C.VIJAYARAJESWARI, Dr.C.SAKTHI KUMAR, M.E,Ph.D.**, and **Dr. SARANYASREE SAKTHI KUMAR B.E,MBA,Ph.D.**, for providing us with the necessary facilities to undertake this project.

We also express our gratitude to our Principal **Dr.K. Mani, M.E,Ph.D.**, who facilitated us in completing the project.

We thank the Head of the CSE Department, **Dr. L. JABASHEELA , M.E,Ph.D.**, for the support extended throughout the project.

We would like to thank our Project Coordinator **Dr.P.J.SATHISH KUMAR BE.,M.Tech.,Ph.D.**, and all the faculty members of the Department of CSE for their advice and encouragement for the successful completion of the project.

AL THAMEEZ S

ALLEN RODDICK A

ABSTRACT

The **File and Folder Organization Bot** is an innovative automation solution designed to streamline file management tasks using **UiPath Studio**. This project leverages **Robotic Process Automation (RPA)** to efficiently categorize, move, and organize files based on predefined rules such as file type, extension, and naming conventions. By automating file handling processes, organizations can significantly **reduce manual effort, minimize errors, and enhance productivity**.

The bot scans directories, identifies files, and relocates them to appropriate folders, ensuring a **structured and well-organized digital workspace**. Advanced automation techniques, including **error handling, dynamic folder creation, and scalable workflow design**, ensure seamless operation. The implementation of this system eliminates redundancy, enhances data accessibility, and optimizes storage management.

In an era where **efficient data organization is crucial**, this project offers a **costeffective, time-saving, and scalable** solution for businesses and individuals. Future enhancements could include **AI-based classification and cloud integration**, further extending its capabilities for advanced file management.

CHAPTER – 1

INTRODUCTION

1.1 OVERVIEW OF PROJECT

Our project, "Automated File & Folder Organization Bot," is a pioneering initiative that harnesses the advanced capabilities of UiPath Studio to streamline digital file management through Robotic Process Automation (RPA). With a meticulously crafted workflow, we address the critical challenge of unstructured file storage by implementing an intelligent, rule-based sorting mechanism.

The bot efficiently categorizes files based on predefined parameters such as file type and extension, ensuring a well-structured and organized storage system. Through dynamic folder creation and seamless file movement, our automation solution eliminates manual intervention, enhances operational efficiency, and minimizes human errors. This initiative represents a transformative leap toward optimizing digital workspace management, fostering a culture of automation, and significantly improving productivity.

Beyond the core functionality of sorting and moving files, our project incorporates robust error handling mechanisms to ensure uninterrupted execution. The workflow is designed to be scalable and adaptable, enabling future enhancements such as scheduled automation, cloud storage integration, and real-time reporting. By leveraging the full potential of UiPath's automation capabilities, this project lays the foundation for an intelligent, self-managing file organization system, empowering users to focus on higher-value tasks while the bot seamlessly handles file management.

1.2 PROBLEM DEFINITION

- Current file management practices heavily rely on manual intervention, requiring users to sort, move, and organize files manually, leading to inefficiencies, errors, and wasted time.
- Manual file organization often results in inconsistencies, as different users may follow varied naming conventions, misplace files, or forget to categorize them properly. This lack of standardization affects data accessibility, retrieval speed, and overall workflow efficiency.
- As file volumes increase, manual sorting becomes unsustainable, posing scalability challenges and making it difficult for organizations

to efficiently manage their growing digital repositories. Without automation, businesses struggle to maintain structured storage, leading to cluttered directories, redundant files, and decreased productivity.

CHAPTER – 2

LITERATURE SURVEY

A comprehensive literature survey highlights the growing importance of automation in file management, particularly through Robotic Process Automation (RPA), Artificial Intelligence (AI), and Machine Learning (ML). Researchers and industry experts have extensively explored various approaches to file organization, storage management, and automation to improve efficiency, accuracy, and scalability.

[1] Van der Aalst (2018) emphasizes the role of RPA in automating repetitive tasks, including file organization. The study highlights how RPA enables organizations to automate rule-based processes with high accuracy, significantly reducing human errors and operational costs. UiPath, a leading RPA tool, has been widely adopted for its drag-and-drop automation capabilities, making it ideal for file handling and classification.

[2] Smith et al. (2020) discuss the significance of rule-based classification in managing unstructured data. By defining file types, naming conventions, and directory structures, automation tools can efficiently categorize and move files, minimizing redundancy and improving accessibility. Our project follows a similar approach by organizing files based on predefined parameters such as file extensions and folder structure.

[3] Patel & Johnson (2021) explore the integration of AI-based classification models to predict file categories beyond basic rules. While our project currently employs a rule-based approach, future enhancements could incorporate AI-powered content recognition to classify files based on their content rather than just metadata.

[4] Brown (2019) outlines the key challenges in manual file organization, citing issues such as time inefficiencies, human errors, and lack of standardization. Organizations dealing with large datasets often struggle with scalability, making automation a necessary solution for structured and optimized file storage.

[5] Geyer-Klingenberg et al. (2020) highlight the effectiveness of UiPath in business process automation. Their research focuses on the pre-built activities in UiPath, such as Move File, Create Directory, and For Each, which are essential for implementing an automated file organization system.

CHAPTER – 3

SYSTEM ANALYSIS

3.1 EXISTING SYSTEM

Transitioning from manual file management to automation is essential for optimizing efficiency and streamlining organizational workflows. However, many organizations still rely on manual processes for handling files and folders, leading to various operational challenges.

Currently, file organization tasks such as sorting, moving, renaming, and categorizing files are performed manually, which poses several limitations. These include time-consuming procedures, a high risk of human errors, lack of scalability, operational inefficiencies, increased costs, and dependency on human intervention. These challenges not only hinder productivity but also increase the likelihood of data mismanagement, redundancy, and security risks.

However, leveraging automation within the existing model offers numerous benefits to address these inefficiencies. Automated solutions streamline workflows, reduce errors, and ensure consistent performance, thereby enhancing operational efficiency. Scalability is significantly improved, as automation can handle large volumes of files dynamically without manual intervention. Additionally, automation reduces labor costs, minimizes the financial impact of human errors, and optimizes resource allocation.

Beyond efficiency gains, automation enhances data security, compliance with regulations, and system reliability. It allows for structured file storage, quick retrieval, and seamless integration with other digital systems, ensuring smooth and organized information management.

To successfully transition to an automated file organization system, organizations must:

- Assess current processes and identify inefficiencies in file management.
- Select appropriate automation tools such as UiPath for seamless implementation.
- Integrate automation solutions with existing infrastructure.
- Provide training and support to employees for effective adoption.
- Implement security measures to ensure compliance and data protection.
- Continuously monitor and optimize workflows for improved performance.

By systematically adopting automation for file and folder management, organizations can unlock new levels of efficiency, agility, and innovation, ensuring long-term success in the digital era.

3.2 PROPOSED SYSTEM

To implement automated file and folder organization effectively, we propose utilizing UiPath Studio, a leading Robotic Process Automation (RPA) tool. UiPath Studio provides a user-friendly interface and a comprehensive set of activities to automate repetitive tasks such as file sorting, folder creation, and document classification. Its drag-and-drop functionality and visual workflow designer allow users to build complex automation sequences without extensive programming knowledge.

By integrating UiPath Studio into the existing file management system, organizations can streamline operations, eliminate manual errors, and enhance productivity. The bot will scan files, classify them based on predefined rules (such as file type, name, or creation date), move them to the appropriate folders, and even create new directories when necessary.

UiPath's robust error-handling mechanisms and logging capabilities ensure that all operations are executed securely and efficiently, while its scalability allows for seamless adaptation to growing data volumes. Furthermore, UiPath offers detailed documentation, training resources, and a strong community support system to assist in the deployment and maintenance of automation projects.

Key Benefits of the Proposed System

- **Enhanced Efficiency:** Automates file organization, reducing the time and effort required for manual sorting.
- **Error Reduction:** Ensures accurate file placement and eliminates human mistakes.
- **Scalability:** Capable of managing large volumes of files across multiple directories.
- **Security & Compliance:** Maintains structured and secure data storage while adhering to organizational policies.
- **Seamless Integration:** Works within existing IT infrastructures without disrupting other processes.

Leveraging UiPath Studio for file and folder organization offers a powerful and scalable solution to overcome the inefficiencies of manual processes. By embracing automation, organizations can achieve greater operational efficiency, reduce costs, and ensure compliance, ultimately driving digital transformation in modern workplaces.

3.3 Hardware Environment:

- Computer with UI Path Studio with version (2023.12.0)
- Multicore processor with a clock speed of 2 GHz or higher.
- Display-Resolution of 1920*1080
- Operating System: Windows 10 (64-bit)
- RAM: Minimum 4 GB
- Storage: Minimum 10 GB free disk space
- Backup and Redundancy: Google Drive, OneDrive, or external storage for data security.

3.4 Software Environment ➤ UiPath Studio (2023.12.0)

- UiPath Robot
- UiPath Orchestrator
- Configuration Management Tools
- Configuration Management Tools
- .NET Framework 4.7.2 or later
- Windows PowerShell
- Document Automation Tools

CHAPTER – 4

SYSTEM DESIGN

4.1. FLOW CHART

Figure 4.1 Flow Chart for Automated File and Folder Organization.

4.2 ARCHITECTURE DIAGRAM

Figure 4.2 Architecture Diagram for Automated File and Folder Organization.

EXPLANATION:

The architecture diagram illustrates the automated file and folder organization system, providing a visual representation of its components and interactions. At its center lies the File Organization Bot, responsible for processing and organizing files based on user-defined rules. This bot retrieves files, applies sorting logic, and moves files to their designated locations. Log generation ensures process transparency and error tracking.

The modular design of the system allows for flexibility and scalability. The bot's independent processing enables efficient handling of large volumes of files without structural changes. Each component operates collaboratively, contributing to the overall efficiency and productivity of the organization. Comprehensive logging and error handling mechanisms are incorporated for system reliability.

Overall, this architecture diagram serves as a blueprint for the automated file organization system, demonstrating how its components work together to streamline file management. This automation improves organizational efficiency by reducing manual effort and ensuring consistent file organization, ultimately supporting strategic growth.

4.3 Data Flow Diagram

DFD are used to Specify Functions of the Information System and how data flow from function to function. A data flow diagram has no control flow, there are no decision rules and no loops. Specific operations based on the data can be represented by a flowchart. The data flow diagram is part of the structured analysis modelling tools

4.3.1 0 LEVEL DFD

Figure explains the overall functionality of the proposed system

Figure 4.3.1 Data Flow Diagram at the Initial Level

4.3.2 FIRST LEVEL DFD

Figure describes about the overall representation of each module and their functions. The level one data flow diagram has various modules and the respective results. This is to clarify the paths (flow) of data and its transformation from input to output.

Figure 4.3.2 Data Flow Diagram Level 1

4.3.3 SECOND LEVEL DFD

Face Recognition System DFD Level 2 is also the highest abstraction of the data flow diagram. This level also broadens the idea from the DFD level 1. It includes the sub-processes from level 1 as well as the data that flows.

Figure 4.3.3 Data Flow Diagram Level 2

UML DIAGRAMS

4.4 USE CASE DIAGRAM

To elucidate the preceding diagrams, utilize the use case diagram using include and extend. Indicators in the use case diagram are the terms include and extend. This example uses include and extend to create a more intricate use case diagram figure. This will assist you in outlining the steps necessary to finish a task or procedure. The following diagrams that are connected to them represent parts of a process, as indicated by the broken arrows. They might represent one of the include or extend signals.

Figure 4.4 Use Case diagram for Automated File and Folder Organization.

4.5 SEQUENCE DIAGRAM

A sequence diagram is a visual representation of how objects or components interact in a system, showing the order of messages exchanged between them. It depicts the flow of control and data as well as the sequence of actions, aiding in understanding the dynamic behavior of the system during the execution of specific scenarios or operations.

Figure 4.5 Sequence Diagram for Automated File and Folder Organization.

4.6 ACTIVITY DIAGRAM

An activity diagram is a type of UML (Unified Modeling Language) diagram that visually represents the flow of activities and actions within a system or process. It depicts the sequence of activities, decision points, and branching paths, along with the order of execution and the conditions under which each activity occurs. Activity diagrams are commonly used to model workflows, business processes, software algorithms, and system behaviors.

Figure 4.6 Activity diagram for Automated File and Folder Organization.

4.7 CLASS DIAGRAM

This simple class diagram gives you the exact details about the system's class characteristics and methods. It also clarifies the connections of classes in the system.

The illustration shows a simple idea of how the class diagram works. It resembles a flowchart in which classes are present in boxes with three rectangles in each. The top rectangle has the class's name; the middle holds the class's properties, and the bottom contains the class's methods.

Figure 4.7 Class diagram for Automated File and Folder Organization.

CHAPTER – 5

MODULE DESCRIPTION

File Detection and Extraction Module:

This module is responsible for identifying files that need to be organized. It scans the designated source folder and retrieves all files based on predefined criteria such as file extension, creation date, or size. The system ensures that every file is recognized and ready for classification. Additionally, if the user enables recursive scanning, the bot can explore subfolders to detect files across multiple directory levels. This module lays the foundation for efficient file management by ensuring that no file is left unprocessed.

Classification and Sorting Module:

After classification, this module ensures that files are moved to their designated folders efficiently. The system automates the transfer of files from the source folder to the appropriate destination directories, preventing disorganization. It also includes mechanisms to handle duplicate files by renaming or skipping them based on predefined settings. This module plays a vital role in maintaining a wellorganized directory structure, ensuring that all files are placed in their correct locations without manual intervention.

Logging and Monitoring Module:

To track the execution of the bot, this module maintains a detailed log of all file movements and actions performed during the automation process. Every successful operation, error, or skipped file is recorded for reference. If integrated with UiPath Orchestrator, the module can display execution statuses and progress updates in real-time. Additionally, summary reports can be generated to provide users with insights into the automation process, helping them monitor efficiency and troubleshoot any issues.

Exception Handling Module:

This module ensures the smooth operation of the automation workflow by handling unexpected errors and disruptions. It detects issues such as missing files, incorrect directory paths, and permission errors, and takes corrective actions where possible. For recoverable errors, the system attempts to retry the operation, ensuring minimal disruptions. In case of critical failures, alerts or notifications can be sent to the user, allowing for timely intervention. This module enhances the bot's reliability by preventing workflow failures and ensuring continuous operation.

User Interface and Configuration Module:

This module provides a user-friendly interface for configuring the automation workflow. Instead of modifying the bot's internal logic, users can define source and destination paths, file organization rules, and other preferences through an interactive setup. This module also allows users to manually trigger or override specific operations, giving them greater control over the file organization process. By making the system adaptable and easy to use, this module enhances the overall usability of the bot.

CHAPTER-6

SYSTEM IMPLEMENTATION

The implementation of the **File and Folder Organization Bot** is carried out using **UiPath Studio**, leveraging its **Robotic Process Automation (RPA) capabilities** to automate file classification, movement, and storage. The first step in implementation involves **setting up the UiPath environment**, which includes installing **UiPath Studio (2023.12.0)**, **UiPath Robot**, and **UiPath Orchestrator (if needed for centralized automation)**. The source and destination folders are defined, along with necessary configurations such as logging and error-handling mechanisms to ensure smooth execution.

The workflow is then developed in **UiPath Studio** using activities such as **Assign, For Each, If Condition, Create Directory, and Move File** to automate the process. The bot scans the source folder, identifies files, categorizes them based on predefined rules (such as file type or naming conventions), and moves them to the appropriate destination folders. If a folder does not exist, the bot dynamically creates it, ensuring a structured file organization system. The process is enhanced with **exception handling mechanisms** such as **Try-Catch blocks, error logging, and retry mechanisms** to prevent failures due to missing files or permission restrictions.

Once the development phase is complete, **testing and validation** are conducted to ensure the bot functions as expected. **Unit testing, integration testing, and performance testing** are carried out to verify that the bot correctly organizes files, handles errors effectively, and operates efficiently even with large volumes of data. After successful testing, the bot is **deployed in a live environment**, where it can be executed manually or scheduled for periodic execution. If integrated with **UiPath Orchestrator**, the process can be centrally managed, monitored, and logged for improved visibility.

Post-deployment, the bot requires periodic monitoring and maintenance to ensure optimal performance. Future enhancements may include **AI-based file classification, cloud storage integration, and automated notifications** to keep users informed about the file organization process. By leveraging **UiPath's automation capabilities**, this system eliminates manual file sorting, improves efficiency, and ensures a well-structured digital workspace, making it a scalable and sustainable solution for file management.

6.1 WORKFLOW

Fig 6.1.1: Workflow for Defining Source Folder and Retrieving Files.

Fig 6.1.2 Workflow for Retrieving Files, Creating Directories, and Moving Files.

CHAPTER-7

CONCLUSION

The **File and Folder Organization Bot**, developed using **UiPath Studio**, streamlines file management by automating the classification, movement, and organization of files, significantly reducing manual effort and errors. By leveraging **rule-based automation**, the bot ensures structured storage and enhances workflow efficiency, making file retrieval seamless. Its **scalability** allows it to handle large volumes of files effortlessly, adapting to different organizational needs. With built-in **error handling and logging mechanisms**, the system ensures reliable execution with minimal disruptions. Future enhancements, such as **AI-powered classification, cloud integration, and real-time notifications**, could further improve its capabilities, making it an intelligent and autonomous file management solution. By implementing this bot, organizations can enhance productivity, minimize human intervention, and create a more efficient and structured digital workspace.

7.1 RESULTS & DISCUSSION

The implementation of the **File and Folder Organization Bot** using **UiPath Studio** successfully automates the process of file management, eliminating the inefficiencies of manual sorting. The bot efficiently classifies files based on predefined rules, creates necessary directories, and moves files to their respective folders with high accuracy. During testing, the automation consistently performed **error-free file organization**, demonstrating reliability and **reducing human intervention** significantly.

The results highlight the **scalability and adaptability** of the bot, handling different file types and varying volumes with ease. The automation process not only saves time but also **ensures data integrity and accessibility**, allowing for improved workflow efficiency. Logging and error-handling mechanisms further enhance the bot's robustness, ensuring smooth operation even in cases of missing files or permission issues.

In discussions, potential enhancements such as **AI-based classification, cloud storage integration, and real-time alerts** were identified as future improvements. These additions could make the system more intelligent and autonomous. Overall, the bot proves to be a **reliable, scalable, and effective solution for automated file management**, offering significant benefits in terms of **efficiency, accuracy, and productivity** in digital workspaces.

7.2 FUTURE ENHANCEMENTS

1.AI-Based File Classification:

Implementing **Machine Learning (ML) and Natural Language Processing (NLP)** will enable the bot to analyze file content rather than just extensions. This will allow for **smarter classification** and adaptability, improving organization accuracy.

2.Cloud Integration:

Extending the bot's functionality to support **Google Drive, OneDrive, or AWS S3** will allow seamless file management across devices. This ensures files are accessible from anywhere, enhancing collaboration and backup options.

3.Real-Time Monitoring and Notifications:

Adding **email or message alerts** will keep users informed about file movements, errors, or required actions. This improves visibility and ensures quick responses to any issues.

4.Customizable User Preferences:

Providing a **user-friendly interface** where users can set custom rules, folder structures, and triggers will make the bot more flexible. This allows it to adapt to different organizational needs without modifying the automation script.

5.Scheduled and On-Demand Execution:

Integrating a **scheduler** will enable the bot to run automatically at specific intervals or on-demand. This ensures timely file organization without requiring manual intervention.

6.Multi-Format Report Generation:

Generating **reports in PDF, Excel, or Word formats** will help track file movements and automation logs. This allows organizations to analyze efficiency and maintain records for auditing purposes.
